309 Worksheet 1.2

State hypothesis and conclusion in the following theorems from calculus:

(1) Theorem: Suppose that the function f is continuous on the closed interval [a, b]. Then f(x) assumes every value between f(a) and f(b).

Hypothesis:

Conclusion:

(2) Theorem: If n is a positive integer and if a > 0 for even values of n then

$$\lim_{x \to a} \sqrt[n]{x} = \sqrt[n]{a}.$$

Hypothesis:

Conclusion:

(3) Theorem: Let C be a piecewise smooth simple closed curve that bounds the region R in the plane. Suppose that the functions P(x, y) and Q(x, y) are continuous and have continuous first-order partial derivatives on R. Then

$$\oint_C Pdx + Qdy = \iint_R (\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y}) dA.$$

Hypothesis:

Conclusion:

(4) Theorem: If f is differentiable at c and is defined on an open interval containing c and if f(c) is either a local maximum value or a local minimum value of f, then f'(c) = 0.

Hypothesis:

Conclusion:

(5) Theorem: Suppose that a function g has a continuous derivative on [a, b] and that f is continuous on the set g([a, b]). Let u = g(x). Then

$$\int_{a}^{b} f(g(x))g'(x)dx = \int_{g(a)}^{g(b)} f(u)du.$$

Hypothesis:

Conclusion:

(6) Theorem: Suppose that the function f is defined on the open interval I and that f'(x) > 0 for all x in I. Then f has an inverse function g, the function g is differentiable, and

$$g'(x) = \frac{1}{f'(g(x))}$$

for all x in the domain of g.

Hypothesis:

Conclusion:
